Blinkit Sales Analysis Dashboard

Tableau Project Report

1. Project Overview

This project uses Tableau to explore Blinkit sales data and communicate business-oriented patterns through KPIs and visual comparisons. The supplied file is a Tableau workbook (.twb), which can store workbook and visualization definitions while referencing an external data source.

2. Project Objectives

• Review total sales and average sales indicators.

• Compare sales across item types and fat-content categories.

• Explore outlet size and outlet location patterns.

• Review outlet establishment trends.

• Present key measures through a clear, portfolio-ready dashboard.

3. Key Performance Indicators

KPI	Purpose
Total Sales	Summarizes overall sales value.
Average Sales	Shows the average sales measure used in the dashboard.
Number of Items	Represents the item count or volume indicator configured in the workbook.
Average Rating	Summarizes the customer rating measure available in the dashboard.

4. Dashboard Visuals

• Sales by Item Type — compares product-category sales.

• Sales by Fat Content — explores sales distribution by fat-content group.

• Sales by Outlet Size — compares outlet-size groups.

• Sales by Outlet Location — compares outlet location categories.

• Outlet Establishment Trends — explores changes by establishment year.

5. Tools and Skills

Tableau • Microsoft Excel • Data Visualization • KPI Reporting • Exploratory Data Analysis • Dashboard Design • Business Storytelling

6. Recommendations

• Add or validate filters for item type, outlet size, outlet location, and establishment year.

• Compare sales alongside ratings and other relevant measures rather than using sales alone.

• Check field definitions, null values, and aggregation settings before interpreting results.

• Keep the original source dataset available; reconnect it in Tableau if prompted.

• For GitHub, include the .twb workbook and README.md. Share the source data only when you have permission.

7. Files and Limitations

The report was prepared from the supplied Tableau .twb file and known project context. The workbook may depend on an external Blinkit.xlsx data source. Numeric KPI totals and measured findings are intentionally not stated here because the source data was not provided with the workbook in this step. Reconnect the dataset in Tableau to verify the dashboard before using it for decisions.
